### 9.3 Other Trig Properties Notes

EQ: How can the remaining trig properties help us simplify trig expressions?

| How are odd and even functions different? | Even Odd <br> $f(-x)=$ $f(-x)=$ |
| :---: | :---: |
|  | Ex. $f(x)=x^{2} \quad$ ex. $f(x)=x^{3}$ |
|  | $f(x) \quad f(x)$ |
|  | $f(2) \quad f(2)$ |
|  | $f(-2) \quad f(-2)$ |
|  | $\text { ex. } \cos \left(-30^{\circ}\right) \quad \text { ex. } \sin \left(-\frac{\pi}{2}\right)$ |
| How can cofunction properties change an expression? | cofunction- $\begin{aligned} & \sin \\ & c s c \\ & \tan \end{aligned}$ |
|  | ex. $\sin \left(30^{\circ}\right) \quad$ ex. $\sec \left(42^{\circ}\right) \quad$ ex. $\cot \left(\frac{3 \pi}{8}\right)$ |
| How do I use sum and difference properties to simplify an expression? | Sum \& Difference Properties <br> Show that $\cos (A+B) \neq \cos A+\cos B$ by letting $A=30^{\circ}$ and $B=90^{\circ}$ |
|  | Ex. $\cos 34^{\circ} \cos 20^{\circ}+\sin 34^{\circ} \sin 20^{\circ} \quad$ ex. $\cos (\pi+x)$ |

Summary
